508449	World War 2 Observation Post Brassington Derbyshire	<p>World War II Royal Observer Corps (ROC) post, approximately 500 metres south of the village of Longcliffe, opened in 1943.. MATERIALS: Red brick on a steep rock outcrop. EXTERIOR: Rectangular in plan, it is a two storey building approximately 3.5 metres high with steep external steps up to the upper floor. The aircraft observation area is open-topped and approximately 2m square, with evidence for the mounting of an instrument table in the centre. From the roof, two steps lead down to the crew room which is approximately 1.25m x 2m with a flat roof. There is a door into the lower room at the bottom of the stairs with a window in the opposite wall. There is an outside toilet block attached to the north wall. HISTORY: Following the extensive bombing of London in 1915 and 1917 and the ensuing public outcry, a unified air defence system was set up under Major General Ashmore. In 1925 trials involving a network of observation posts linked by telephone were carried out in co-operation with the RAF to test a system for identifying and tracking enemy aircraft. The trials were so successful the Observer Corps were set up in the same year. Initially the network was confined to the Maidstone and Horsham areas but during the 1930's as the threat of war increased, the Observer Corps system was increased to cover the whole of the British Isles. In 1935, an improved post instrument had been introduced and by 1938 there were about 1400 posts. Eighteen of these posts were in Derbyshire. When war was declared in 1939, the Observer Corps posts had been manned for two weeks. In 1941 the contribution made by the Observer Corps was formally recognised by the granting of the title 'Royal Observer Corps'</p>	II	18/10/2010

		<p>(ROC) by George VI who also became the first Air Commodore-in-Chief. Following the end of WWII, the ROC had a brief period of stand-down before it was reactivated in 1947 in response to the increased tension with the Eastern Block. By the 1950's the threat of nuclear attack persuaded the Government to set up the United Kingdom Warning and Monitoring Organisation (UKWMO). The Royal Observer Corps was given the job of collecting information on the location of nuclear bombs, information on weapon sizes, fall-out information, and basic weather information. In 1968 nearly 700 posts were closed. The WWII Royal Observer Corps at Brassington was opened in 1943 and was built to what became a standard RAF pattern. It became part of the 'Granite' system, a code for posts which were equipped with flares to warn friendly aircraft of high ground in poor visibility. The system is estimated to have prevented up to seven thousand accidents. It continued in use until 1964 when the main role of the ROC became nuclear reporting and the underground post, which lies approximately 150m to the south-east, came into use. The latter was decommissioned in 1991, when the ROC was finally stood down. SOURCES: www.subterranea.brittanica.org.u, accessed 17 April 2010. Cocroft, Wayne. 'Cold War Monuments: An Assessment by the Monuments Protection Programme' English Heritage. Layne, Jon. 'The Royal Observer Corps in Derbyshire' Unpublished paper. REASONS FOR DESIGNATION DECISION: The World War II ROC observation tower at Brassington is listed as Grade II for the following principal reasons: Architectural Interest : An example of a standard functional design, yet of an unusual building type, which is an architectural representation of the changing threats to national security. Historical Interest: The juxtaposition of the WWII ROC post with the adjacent UKWMO monitoring station reflects the continuity and change in the role of the ROC, and</p>

508494	Royal Observer Corps Underground Monitoring Station Brassington Derbyshire	<p>UKWMO underground monitoring post, which opened in 1964. MATERIALS, PLAN, EXTERIOR AND INTERIOR: The subterranean building is constructed entirely of concrete. The ROC post is visible on the surface as a grassy mound with a concrete ventilation shaft with two louvered vents at each end. That to the southern end is adjacent to an entrance shaft. A vertical pipe extending above ground between the two ventilation posts would have been the base plate for a Bomb Power Indicator, an instrument introduced to these monitoring posts around 1958 when inadequacies of the earlier monitoring instruments were identified. The monitoring posts were built to a standard design. The single entrance shaft is approximately 4.5m deep and gives access to two rooms, one containing a chemical toilet and the larger operations room which measures approximately 4.5m x 2.25m. In 2001 it was recorded that within the Brassington UKWMO post a number of items survive including : beds, mattresses, shelving, an instrument table, a WB1410 carrier receiver, a WB1410 water filter, BT connection boxes and wiring, posters and an original folding canvas chair. Telephones and other mechanical equipment had been removed. HISTORY: Following the end of WWII, the ROC had a brief period of stand-down before it was reactivated in 1947 in response to the increased tension with the Eastern Block. By the 1950's the threat of nuclear attack persuaded the Government to set up the United Kingdom Warning and Monitoring Organisation (UKWMO). The Royal Observer Corps was given the job of collecting information on the location of nuclear bombs, information on weapon sizes, fall-out information, and basic weather information. In 1968 nearly 700 posts were closed. The UKWMO underground post at Brassington came into use in 1965 when the main role of the ROC became nuclear reporting. The monitoring station was decommissioned in 1991, when the ROC was finally</p>	II	18/10/2010
